Installation of Acrylic Light Panels
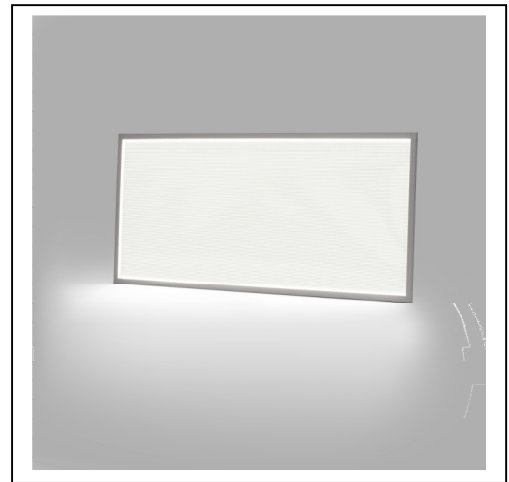

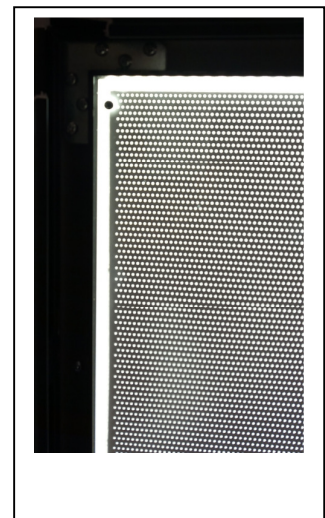

The package contains:
1 acrylic light panel
1 set of "Z" clips (optional)
1 white acrylic diffuser (optional, installed)
1 power supply & cord

1. An acrylic light panel has LEDs on one, two,
    or all edges. A white acrylic can be attached
    on the face, as an option.

2. The panel can be screwed to the wall, using the holes
on the face of the panel. Using a level, make sure
 the panel is leveled, then mark the holes on the wall,
drill the holes on the wall, and use plastic plugs and #8
or #10 screws to attach the panel to the wall.

3. Alternatively, a set of "Z" clips can be used to hang the frame. The "Z" clip set comes in two parts: one is attached to the light box, and the other is screwed to the wall.

4. Plug in the female connector on the light box to the male connector on the power supply.
